Allergické projevy po novejsich ocních lecích Allergic manifestations caused by the administration of some modern eye drugs Československa Oftalmologie 1948, 4 (205-212) Illus. 1

Report of three cases of allergic reaction to sulphonamides: morbillous exanthema following local therapy with cibazol ointment associated with cibazol in pills; maculopapular exanthema due to sulphathiazole ointment and sulphathiazole in pills; eczematous follicular conjunctivitis due to 5% albucid drops. Several cases of allergy due to local application of penicillin in drops and in ointment are described. In one case the local administration was associated with intramuscular injection. The allergic reaction manifested itself as local eczema, oedema of the lids and conjunctival chemosis. It also took a form of generalized weeping eczema, urticaria with dermatographia, and exudative erythema with swelling of the joints and rise of temperature. Most patients subsequently showed local reactions to other eyedrops. In allergic subjects penicillin can provoke a non-specific polyvalent hypersensitivity to currently used drugs and can make the treatment of serious eye diseases very difficult. Finally, bullous urticarial exanthema is mentioned, due to the synthetic drug glaucit (Czechoslovak-made adrenaline ointment for conservative treatment of secondary glaucoma). The allergic reaction was exerted by the aethylum p-amino-benzoicum component of the ointment.

SOV/115-58-1-23/50

AUTHOR: Votlokhin, B.Z.
 TITLE: A Servo-Motor-Driven Level Meter and a Flow Densimeter (Sledyashchiy motornyy urovnemer i protochnyy plotnomer)

PERIODICAL: Izmeritel'naya tekhnika, 1958, Nr 1, pp 40 - 42 (USSR)

ABSTRACT:

The article gives a detailed description of two devices, the first of which is an automatically recording level meter for granulated masses or liquids, used at the catalyst factory of the Novo-Groznenskiy neftepererabatyvayushchiy zavod (Novo-Groznyy Oil Refinery) for automatically registering the level of a spherical catalyst in a flow line. The device has a float hanging on a cable which runs over a drum driven by a reversible electric motor controlled by an electronic relay. The level readings are transmitted and recorded by an inductive transducer with an accuracy within ± 1 cm over a level range of 100 cm. When the level suddenly rises, the submerged float will be automatically pulled out. The second device is a densimeter for running liquids, which measures the density of liquids by specific weight. This device has a sensitive square pipe connected by flexible metal hoses to the supply pipe, and a reversible electric motor controlled by a movable contact moving between two fixed contacts. This

Card 1/2

SOV/115-58-1-23/50

A Servo-Motor-Driven Level Meter and a Flow Densimeter

motor controls the tension of a spring connected with the pipe. The device has been laboratory-tested on a liquid density range between 0.700 and 0.800 g/cm³ and proved reliably indicating changes of the density as small as 0.001 g/cm³. There are 2 diagrams and 1 Soviet reference.

TITLE: ~~A Portable Battery-Operated Indicator for Determining Radio-~~
activity (Portativnyy batareynnyy indikator radioaktivnogo
izlucheniya)

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol. 24, Nr 8,
pp. 1032 - 1032 (USSR)

ABSTRACT:

Radioactive indicators often have special electronic apparatus to increase the potential in indicating halogen numbers, but a great deal of energy is required to do this. A pocket indicator is described which has counters of the STS-1 type. The number of counters used depends on the sensitivity desired in counting β - and γ -rays. A schematic representation of the indicator is given. The presence of radioactive material is determined by the clicks caused by the impulses of the discharge current. The intensity of the radiation is indicated by the frequency of the clicks. The apparatus contains an anode battery of the type GBCh-SA -30 and condensers of the type MBGP. The indicator was first devised in 1955 and has since operated properly without having to replace batteries. There is 1 figure.

SUBJECT	USSR / PHYSICS	CARD 1 / 2	PA - 1960
AUTHOR	YOTRUBA		
TITLE	The First Session of the Scientific Council of the United Institute for Nuclear Research.		
PERIODICAL	Atomnaja Energija, 2, fasc.1, 72-74 (1957)		
	Issued: 3 / 1957		

In accordance with the agreement concerning the organization of this United Institute, which was concluded by 11 countries, an international scientific research organization for the joint carrying out of theoretical and experimental research within the field of nuclear physics was created. As to the main principles of the organization of this Institute see "Pravda", 12.July 1956. From the 20. to the 23. September 1956 a conference of the authorized representatives of the governments of the member countries was held at the Institute concerning the approval of the statute on which occasion the definite text of the statute was unanimously approved. (For the complete text of the statute see: Atomnaja Energija, 2, fasc.1, 76 (1957)). Also other countries can participate in the work performed by this Institute, and thus North-Vietnam joined the organization as its 12th member.

After the statute had been approved and signed, the first session of the scientific council of the United Institute took place on the 24th September. Delegates of all (European and Asiatic) communist states are entitled to a seat and to the right of vote at these sessions in addition to a director and two vice-directors. The directors of laboratories have a consultative vote. At the conference of the

over

Atomnaja Energija, 2, fasc.1, 72-74 (1957) CARD 2 / 2

PA - 1960

scientific council the draft concerning constitution of the scientific council of the Institute was discussed and confirmed. Next, the candidates proposed for the posts of laboratory directors by the management of the Institute were confirmed. The following directors were elected by secret ballot: Laboratory for high energies: V.I. VEKSLER, Laboratory for Nuclear Problems: V.P. DŽELEPOV, Laboratory for Theoretical Physics: N.N. BOGOLJUBOV. Furthermore, the scientific council approved the candidature of I.M. FRANK for the post of director of the laboratory for neutron physics, which will be established within short. Furthermore, the plan for the further development of the Institute in 1956-1960 was accepted. The director of the Institute, D.I. BLOCHINCEV, submitted a project for the completion of the experimental equipment of the large synchrotron for 10 BeV by a new pavilion for work with photoplates and bubble chambers in momentumlike magnetic fields to the scientific council. Furthermore, the construction of a large chamber for liquid water and the building of a kryogen factory was suggested. It was further suggested that a new building with large library and with electronic rapid counters was planned for the laboratory for theoretical physics. The scientific council approved the plans mentioned here for scientific research work of all four laboratories of the Institute.

TITLE:

A Note on the Influence of Plastic Deformation on the Barkhausen Effect (Vliyaniye plasticheskoy deformatsii na effekt Barkgauzena).

PERIODICAL:

Izvestiya AN SSSR Seriya Fizicheskaya, 1957, Vol. 21, Nr 9, pp. 1246-1249 (USSR.).

ABSTRACT:

From the three methods employed at present, here the direct method was used (applied by Tabb, R., Bush H., Krantz J. and by the author). The influence of plastic deformation on the Barkhausen effect in "Mu-metal", in "Gaypernik"; iron and nickel was investigated. The substances were technically pure and were not subjected to further purification. It is shown, that the Barkhausen effect increases with deformation in the case of "Mu-metal" and "Gaypernik", and decreases slowly in iron and faster in nickel. In nickel the Barkhausen effect passes through its minimum at a 10% deformation. These results can be explained theoretically. According to Tebble the Barkhausen effect is caused by inhomogeneities of internal stress, the diameter of which approaches the thickness of the boundary layer. This thickness, is, according to Bloch, F, and Landau, L., (ZS. Phys. 74, 295 (1932) and Sov. Phys. 8, 153 (1935) equal to:

Card 1/2

A Note on the Influence of Plastic Deformation on the Barkhausen Effect.

48-9-9/26

$$b \approx (K + \frac{3}{2} \lambda \sigma)$$

K denoting the constant of magnetic anisotropy, λ magnetostriction, σ the mechanical stress. In nickel K is small and λ large. Therefore the boundary layer thickness decreases at a rise of the mechanical stress. The Barkhausen effect diminishes from the same considerations. On a deformation, however, the inhomogeneities of the internal stress decrease. Therefore the Barkhausen-effect must grow at the same time. By this the minimum at a deformation of about 10% is explained. In the case of iron K is larger and the boundary layer thickness decreases more slowly. In the case of "Mu-metal" and of "Gypermik" both λ and K have small values. Therefore the boundary layer thickness is great and the number of inhomogeneities with such large diameter is small. Here the Barkhausen-effect is weak without deformation and only grows with an increase of the number and of the diameter of inhomogeneities on deformation. The model given here is only a rough one and will furnish only a quantitative agreement. There are 6 figures and 16 references, 5 of which are Slavic.

one model to the other is introduced. An analysis of the experimental data on jet showers has shown that for primary energies $E_0 \lesssim 10^{12}$ eV ($\gamma_c \lesssim 20$) the jet showers are better described by the isobar model, whereas in the region $E_0 \gtrsim 10^{12}$ eV ($\gamma_c \gtrsim 20$) the two-center model is better. The transition region between the two ranges of applicability of the two models is sufficiently broad and indicates that the excitation of the colliding nucleons is also influenced by other factors in addition to the primary energy. V. Guzhavin.

The decay of μ mesons. K. Yaguchi, (Charles Univ., Prague, Czech.) and C. Murtha, (Phys. Rev. 82, 100 (1954)). -- Osawa and Kamefuchi (Progress Theoret. Phys. (Japan) 8, 311 (1960)) have shown that a μ meson may decay into an electron or μ^+ in the Coulomb field of a nucleus. The same process should be possible in the field of an electron. The probability of this and related events is calculated. The absence of the μ^+ track from the end of some μ^+ meson tracks must be accounted for in another way. G. M. Betty.

2753. A contribution to the theory of the decay of μ -mesons. C. MURZIK and V. VOTRUBA. Czechoslovak J. Phys., 1, No. 2, 65-72 (1955).

Deals with the probability of the spontaneous decay of a μ -meson into one electron and one photon and also the probability of two-neutrino annihilation of the positive μ -meson with an electron in condensed matter. These probabilities are compared with the probability of the standard spontaneous decay of the μ -meson (into one electron and two neutrinos). Attention is called to the possibility of still other modes of μ -meson decay in matter.

Isotopic spin of elementary particles. Václav Votruba
and J. J. Mitchell (Charles Univ., Prague)
J. Phys. 2, 1-12 (1963) (in English); cf. C.A. 46, 6470b.
Math. It is shown how elementary particles can be grouped
in terms of their ordinary and isotopic spins. The lepton,
with ordinary spin $1/2$ and isotopic spin 1, has 3 charge states,
the electron, the positron, and the Majorana neutrino. The
pion, with ordinary spin 0 and isotopic spin 1, also has 3
charge states, π^+ , π^- , and π^0 mesons. The nucleon, with
ordinary spin $1/2$ and isotopic spin $1/2$, has 4 states, proton,
neutron, anti-proton, and anti-neutron. Interactions of
the lepton field and of the pion field with the electromag-
netic and the nucleon fields are considered. The theory is
shown to be independent of the representation of the isotopic
spin operators.

Votruba, Václav, and Lokajšček, Miloš *Nucleon Isobars* 1-P/W
and pion scattering. Czechoslovak J. Phys. 4, 1-13
 (1954). (Russian summary)

On the basis of the apparent occurrence of an isobaric state of the nucleon in recent pion-nucleon scattering experiments, the authors assume that the nucleon is a Dirac particle, the isotopic spin vector of which can have two different lengths, $1/2$ and $3/2$. A convenient set of matrices is introduced to describe this situation and the algebraic relations between them are given. They are further investigated in the paper reviewed hereafter. The rest of the present paper discusses briefly the coupling between nucleon and pion and its implications for pion-nucleon scattering.

L. Van Hove (Utrecht).

Votruba, V., and Christof. Christo Janko. The Algebra des Isotopen Spins (§. §). Czechoslovak J. Phys. 4, 463-488 (1954). (Russian summary)

All irreducible hermitian matrix representations are determined for a system of relations established previously by Votruba and Lokajšček for special matrices encountered in the combination of representations $D_{1/2}$ and $D_{3/2}$ of the three-dimensional rotation group [see the paper reviewed above].

CZECHOSLOVAK JOURNAL OF PHYSICS
Vol 4, No. 4, November, 1954

Algebra of the isotope spin ($3/2, 1/2$).
All irreducible systems of n hermitic matrices $\{t_i\}$ which specify the cyclic exchange relation of the third order (see eq. (143), p. 405) are explicitly determined. It is found that particularly for $n = 3$ only two non-trivial solutions exist, one a six-series one and the other a four-series one. The first-mentioned one is equivalent to a matrix system introduced by Votruba-Lokajicek for describing the behavior of the isotopic spins of nucleons. The second solution fulfils also the Kemmer relations. For each value of $n > 3$ there is only one non-trivial solution, namely the Kemmer one of the order $H = n + 1$.

VDI KUBA, V.

"8.3 Billion Electron-Volts," by Prof D. Blokhintsev (USSR), director of the Joint Institute of Nuclear Research; Prof V. Votruba (Czechoslovakia), vice-director; and Prof M. Danysh, (Poland), vice-director; Moscow, Pravda, 11 Apr 57

The following is the text of a telephone communique datelined Dubna, 10 April:

"The synchrophasotron installed in the Laboratory of High Energy Physics, Joint Institute of Nuclear Research, has begun operation. Protons have already been accelerated to energies of 8.3 billion electron-volts with this installation.

"The highest particle energy which physicists have ever achieved artificially has been attained.

"Setting the synchrophasotron of the joint institute in operation will create excellent opportunities for completing a broad program of scientific research. The members of the Joint Institute of Nuclear Research come from 12 states and have equal status.

"Work continues on further adjustments of the synchrophasotron and in further increasing the energy of the particles accelerated in it to 10 billion electron-volts." (U)
